DetectX®

Superoxide Dismutase (SOD) Colorimetric Activity Kit

2 Plate Kit  Catalog Number K028-H1

Species Independent

Sample Types Validated:

Serum, Plasma, Cells, Tissues and Erythrocyte Lysates

Please read this insert completely prior to using the product. For research use only. Not for use in diagnostic procedures.

BACKGROUND

Short-lived and highly reactive oxygen species (ROS) such as O₂⁻ (superoxide), OH (hydroxyl radical), and H₂O₂ (hydrogen peroxide) are continuously generated in vivo. In the resting state, the balance between antioxidants and oxidants is sufficient to prevent the disruption of normal physiologic functions; however, either increases in oxidants or decreases in antioxidants can disrupt this balance giving rise to elevated levels of reactive oxygen species (ROS)¹,².

The cellular levels of ROS are controlled by antioxidant enzymes and small molecule antioxidants. The major antioxidant enzymes, superoxide dismutases (SODs), including copper-zinc superoxide dismutase (Cu/ZnSOD, SOD1), manganese superoxide dismutase (MnSOD, SOD2) and extracellular superoxide dismutase (EC-SOD, SOD3), all play critical roles in scavenging O₂⁻. Decreased SOD activity results in elevated level of superoxide which in turn leads to decreased NO but increased peroxynitrite concentrations. The major intracellular SOD is a 32-kD copper and zinc containing homodimer (Cu/Zn SOD). The mitochondrial SOD (MnSOD) is a manganese-containing 93-kD homotetramer that is synthesized in the cytoplasm and translocated to the inner matrix of mitochondria. EC-SOD is the primary extracellular SOD enzyme and is highly expressed in many organs. Increased SOD activity levels are seen in Downs Syndrome³ while decreased activity is seen in diabetes, Alzheimer’s disease, rheumatoid arthritis, Parkinson’s disease, uremic anemia, atherosclerosis, some cancers, and thyroid dysfunction³-⁸.

ASSAY PRINCIPLE

The DetectX® Superoxide Dismutase (SOD) Activity Kit is designed to quantitatively measure SOD activity in a variety of samples. The assay measures all types of SOD activity, including Cu/Zn, Mn, and FeSOD types. Please read the complete kit insert before performing this assay. A bovine erythrocyte SOD standard is provided to generate a standard curve for the assay and all samples should be read off of the standard curve. Samples are diluted in our specially colored Assay Buffer and added to the wells. The Substrate is added followed by Xanthine Oxidase Reagent and incubated at room temperature for 20 minutes. The Xanthine Oxidase generates superoxide in the presence of oxygen, which converts a colorless substrate in the Detection Reagent into a yellow colored product. The colored product is read at 450 nm. Increasing levels of SOD in the samples causes a decrease in superoxide concentration and a reduction in yellow product. The activity of the SOD in the sample is calculated after making a suitable correction for any dilution, using software available with most plate readers. The results are expressed in terms of units of SOD activity per mL.

SUPPLIED COMPONENTS

Clear 96 well Half Area Plates
See www.arborassays.com/resources/#general-info for plate dimension data.
- 2 Plates Catalog Number X018-2EA

Superoxide Dismutase Standard
1 Unit/vial of bovine Erythrocyte Superoxide Dismutase lyophilized.
- 1 Vial Catalog Number C098-1EA

Assay Buffer
Buffer containing detergents, stabilizers and dye.
- 50 mL Catalog Number X100-50ML

Xanthine Oxidase Buffer
Buffer containing detergents and stabilizers.
- 6 mL Catalog Number X102-6ML

Xanthine Oxidase Concentrate
A 25X concentrated suspension of Xanthine Oxidase.
- 225 µL Catalog Number C099-225UL

Substrate Diluent
Substrate buffer. Keep tightly capped.
- 12 mL Catalog Number X101-12ML

Substrate Concentrate
A 10X concentrate of the Detection Reagent.
- 1.1 mL Catalog Number C100-1.1ML

STORAGE INSTRUCTIONS

All components of this kit should be stored at 4°C until the expiration date of the kit.

Once reconstituted, the Superoxide Dismutase Standard should be aliquoted and stored at -20°C.
OTHER MATERIALS REQUIRED

2 mM Potassium Cyanide solution for inhibition of Cu/Zn and extracellular SOD if desired.
Repeater pipet with disposable tips capable of dispensing 25 µL and 50 µL.
96 well plate reader capable of reading optical absorption at 450 nm.
Software for converting optical density (OD) readings from the plate reader and carrying out four parameter logistic curve (4PLC) fitting. Contact your plate reader manufacturer for details.

PRECAUTIONS

As with all such products, this kit should only be used by qualified personnel who have had laboratory safety instruction. The complete insert should be read and understood before attempting to use the product.

SAMPLE TYPES AND PREPARATION

Iron containing SODs (FeSOD) are found in some bacteria and plants and have similar properties to MnSOD (SOD2). Extracellular SOD (SOD3) is obtained from serum, plasma, ascites or synovial fluid fluids.

Samples that need to be stored after collection should be stored at -70°C or lower, preferably after being frozen in liquid nitrogen. This assay has been validated for serum, plasma and erythrocyte lysates. Samples containing visible particulate should be centrifuged prior to using.

Samples should be kept on ice to maintain enzyme activity.

Plasma and Serum Samples
1a. Collect plasma in heparin or EDTA tubes. Centrifuge the sample at 700 x g for 15 minutes at 4°C. Aspirate off the pale yellow supernatant. Assay immediately or freeze at -80°C.

b. Collect blood in serum tubes. Centrifuge the sample at 700 x g for 15 minutes at 4°C. Aspirate off the serum supernatant. Assay immediately or freeze at -80°C.

2. Plasma and serum should be diluted at least 1:5 by taking one part of sample and adding 4 parts of Assay Buffer prior to assaying. Further dilutions in Assay Buffer may be needed.

NOTE: Some serum and plasma samples may contain significant hemoglobin concentrations and the optical density at 450 nm determined prior to running the assay. After addition of the Substrate solution to all the used wells the optical density at 450 nm should be read and subtracted from the optical density recorded at the end of the 20 minute incubation.
**RBC/Erythrocytes**

1. Erythrocytes can be lysed by taking the pelleted RBCs from the Plasma step above and adding 4 volumes of ice cold deionized water.

2. Centrifuge at 10,000 x g for 15 minutes at 4°C to remove debris.

3. RBCs should be diluted at least 1:100 prior to running in the assay. Take 10 µL of lysed RBCs and add to 990 mL of Assay Buffer prior to assaying. Further dilutions in Assay Buffer may be needed.

   **NOTE:** Lysed RBCs will exhibit high background color. After adding the Detection Substrate solution read the blank OD at 450 nm prior to addition of Xanthine Oxidase reagent.

**Cell Suspensions and Adherent Cells**

1a. Centrifuge \( > 1 \times 10^6 \) cells in suspension at 250 x g for 10 minutes at 4°C. Discard the supernatant.

   b. Resuspend the cell pellet in ice-cold PBS and transfer to a microtube on ice. Centrifuge, discard supernatant, and place on ice.

2a. Wash \( > 1 \times 10^6 \) adherent cells with PBS prior to being harvested by gentle trypsinization. Transfer to a tube on ice and centrifuge at 250 x g for 10 minutes at 4°C and discard the supernatant.

   b. Wash the pellet with ice-cold PBS and centrifuge at 250 x g for 10 minutes at 4°C.

3. Homogenize or sonicate the pellet in 0.5-1 mL of PBS per 100 mg of cells. Centrifuge at 1,500 x g for 10 minutes at 4°C.

4a. Collect the supernatant and assay immediately, or store at -80°C. Dilute at least 1:4 in Assay Buffer prior to measuring SOD activity. A 1:4 dilution of the sample is made by adding 3 parts of Assay Buffer to 1 part of supernatant.

   b. To measure cytosolic (SOD1, Cu/Zn) and/or mitochondrial SOD (SOD2, Mn) the sample supernatants should be centrifuged at 10,000 x g for 15 minutes at 4°C. The supernatants will contain the cytosolic SOD and the cell pellets will contain mitochondrial SOD. To determine Mn SOD (SOD2) activity treat samples with 2 mM potassium cyanide. Addition of cyanide will inactivate other SOD enzymes.

**Tissue Samples**

1. Wash tissue thoroughly with ice cold PBS prior to processing.

2. Homogenize as described in steps (3) and (4) for Cell Suspensions above.
STANDARD PREPARATION

Standard Preparation
Superoxide Dismutase Standards are prepared by labeling tubes as #2 through #7. The lyophilized vial of SOD Standard is used for Standard 1. Add 250 µL of Assay Buffer to the vial, vortex and let stand at room temperature for 5 minutes. Pipet 75 µL of Assay Buffer into tubes #2 to #7. Carefully add 75 µL of the SOD Standard from the vial to tube #2 and vortex completely. Repeat this for tubes #2 through #7. The activity of SOD in the SOD Standard vial and tubes 2 through 7 will be 4, 2, 1, 0.5, 0.25, 0.125 and 0.0625 U/mL.

Use all Standards within 2 hours of preparation. Aliquot the reconstituted SOD vial and freeze at -20°C.

ASSAY PROTOCOL

Use the plate layout sheet on the back page to aid in proper sample and standard identification.

The Assay Buffer contains detergents. When pipetting samples or standards into the wells CAREFULLY add the sample slowly down the side of the well. Use Reverse Pipetting* to avoid bubbles!

1. Pipet 10 µL of samples or appropriate standards into duplicate wells in the plate.
2. Pipet 10 µL of Assay Buffer into duplicate wells as the Zero standard.
3. Add 50 µL of the Substrate Preparation to each well using a repeater pipet. NOTE: If your samples have significant yellow coloration then pre-read the optical density at 450 nm.
4. Add 25 µL of the Xanthine Oxidase Preparation to each well using a repeater pipet.
5. Incubate at room temperature for 20 minutes.
6. Read the optical density at 450 nm.

* Reverse pipetting involves pressing the plunger down to the blow-out prior to picking up standards and samples. The selected volume of liquid plus an excess is pulled into the pipette tip. To dispense, the plunger is pressed only down to the first position, leaving some liquid in the tip. This way, liquid remains inside the tip when dispensing, minimizing bubble formation.
CALCULATION OF RESULTS

Average the duplicate OD readings for each standard and sample.

Or use the online tool from MyAssays to calculate the data:

If your sample was visibly colored, then subtract the pre-read optical density at 450 nm from the subsequent Xanthine Oxidase reaction optical density after 20 minutes.

Inhibition values are sometimes quoted for SOD activity. Inhibition values can be obtained by dividing the measured Mean OD for the standard or samples by the Mean OD for the Zero standard (No SOD) and multiplying the result by 100. Create a standard curve by reducing the data using computer software capable of generating a four-parameter logistic curve (4PLC) fit. The sample activities obtained should be multiplied by the dilution factor to obtain neat sample values.

</table>

Always run your own standard curves for calculation of results. Do not use these data.

**SOD Unit Definition**
One unit of SOD is defined as the amount of enzyme causing half the maximum inhibition of the reduction of 1.5 mM Nitro blue tetrazolium in the presence of riboflavin at 25°C and pH 7.8.
Always run your own standard curves for calculation of results. Do not use this data.

**VALIDATION DATA**

**Sensitivity**
Sensitivity was calculated by comparing the ODs for twenty wells run for each of the zero and standard #7. The detection limit was determined at two (2) standard deviations from the zero along the standard curve. Sensitivity was determined as 0.044 U/mL.
**Linearity**
Linearity was determined by taking two samples, one with a high known SOD activity and the other with a lower SOD activity and mixing them in the ratios given below. The measured activities were compared to the expected values based on the ratios used.

SAMPLE VALUES

Five random adult human serum and plasma samples were diluted in Assay Buffer and run in the assay. The serum samples ranged from 1.95 to 4.60 U/mL with an average of 3.44 U/mL. EDTA plasma samples ranged from 2.24 to 3.56 U/mL with an average 2.89 U/mL. Five samples of RBC from EDTA were normalized to hemoglobin levels using the DetectX® Hemoglobin Detection kit, K013-H1. The RBC activities ranged from 748 to 1,507 U/g Hgb with an average of 1052 U/g Hgb.
LIMITED WARRANTY

Arbor Assays warrants that at the time of shipment this product is free from defects in materials and workmanship. This warranty is in lieu of any other warranty expressed or implied, including but not limited to, any implied warranty of merchantability or fitness for a particular purpose.

We must be notified of any breach of this warranty within 48 hours of receipt of the product. No claim shall be honored if we are not notified within this time period, or if the product has been stored in any way other than outlined in this publication. The sole and exclusive remedy of the customer for any liability based upon this warranty is limited to the replacement of the product, or refund of the invoice price of the goods.
