BACKGROUND

The first insect molting hormone was isolated from silkworm pupae and determined to be a steroid, so named ecdysone, in 1954. Later, 20-hydroxyecdysone was identified in crayfish and recognized as a derivative of ecdysone. These molecules and related forms are a family of steroid hormones that regulate metamorphosis, cell death, reproduction in arthropods, and are widely distributed in plant species (phytoecdysteroids). Of the many ecdysteroids, 20-hydroxyecdysone is the most functionally active and widely distributed in arthropods. To accommodate growth during all immature stages of insects and other arthropods, 20-hydroxyecdysone levels change and activate signaling through an ecdysone receptor that results in the synthesis of a new exoskeleton and ecdysis of the old cuticle. In female mosquitoes and flies, 20-hydroxyecdysone regulates egg development. In plants, 20-hydroxyecdysone facilitates the defense mechanisms against insects. Recent studies of vertebrate animals have discovered the ability of 20-hydroxyecdysone to increase osteogenesis and bone mass by reducing cartilage degradation and increasing protein synthesis in humans. There is also medical research and marketing interest in the use of 20-hydroxyecdysone as a bodybuilding supplement to increase muscle mass.

![20-Hydroxyecdysone](image)

ASSAY PRINCIPLE

The DetectX® 20-Hydroxyecdysone (20E) Immunoassay kit is designed to quantitatively measure 20E present in extracted tissue samples from hemolymph, plants, or anthropods. Please read the complete kit insert before performing this assay. A 20-hydroxyecdysone standard is provided to generate a standard curve for the assay and all samples should be read off the standard curve. Standards or diluted samples are pipetted into a clear microtiter plate coated with an antibody to capture rabbit antibodies. A 20-hydroxyecdysone-peroxidase conjugate is added to the standards and samples in the wells. The binding reaction is initiated by the addition of a polyclonal antibody to 20-hydroxyecdysone to each well. After a 2 hour incubation the plate is washed and substrate is added. The substrate reacts with the bound 20-hydroxyecdysone-peroxidase conjugate. After a short incubation, the reaction is stopped and the intensity of the generated color is detected in a microtiter plate reader capable of measuring 450 nm wavelength. The concentration of the 20-hydroxyecdysone in the sample is calculated, after making suitable correction for the dilution of the sample, using software available with most plate readers.

## SUPPLIED COMPONENTS

### Clear Coated 96 Well Plate
Clear plastic microtiter plate(s) coated with goat anti-rabbit IgG.
- **Kit K066-H1 or -H5**
- **Quantity:** 1 or 5 Each
- **Catalog Number:** X016-1EA

### 20-Hydroxyecdysone Standard
20-Hydroxyecdysone at 2,500 ng/mL in a special stabilizing solution.
- **Kit K066-H1 or -H5**
- **Volume:** 40 µL or 200 µL
- **Catalog Number:** C040-40UL or -200UL

### DetectX® 20-Hydroxyecdysone Antibody
A rabbit polyclonal antibody specific for 20-Hydroxyecdysone.
- **Kit K066-H1 or -H5**
- **Volume:** 3 mL or 13 mL
- **Catalog Number:** C238-3ML or -13ML

### DetectX® 20-Hydroxyecdysone Conjugate
A 20-Hydroxyecdysone-peroxidase conjugate in a special stabilizing solution.
- **Kit K066-H1 or -H5**
- **Volume:** 3 mL or 13 mL
- **Catalog Number:** C239-3ML or -13ML

### Assay Buffer Concentrate
A 5X concentrate that must be diluted with deionized or distilled water.
- **Kit K066-H1 or -H5**
- **Volume:** 28 mL or 55 mL
- **Catalog Number:** X053-28ML or -55ML

### Wash Buffer Concentrate
A 20X concentrate that must be diluted with deionized or distilled water.
- **Kit K066-H1 or -H5**
- **Volume:** 30 mL or 125 mL
- **Catalog Number:** X007-30ML or -125ML

### TMB Substrate
A 11 mL or 55 mL solution of hydrochloric acid. **CAUSTIC.**
- **Kit K066-H1 or -H5**
- **Volume:** 11 mL or 55 mL
- **Catalog Number:** X019-11ML or -55ML

### Stop Solution
A 1M solution of hydrochloric acid.
- **Kit K066-H1 or -H5**
- **Volume:** 5 mL or 25 mL
- **Catalog Number:** X020-5ML or -25ML

### Plate Sealer
- **Kit K066-H1 or -H5**
- **Quantity:** 1 or 5 Each
- **Catalog Number:** X002-1EA

## STORAGE INSTRUCTIONS

All components of this kit should be stored at 4°C until the expiration date of the kit.
OTHER MATERIALS REQUIRED

Distilled or deionized water.

Repeater pipet, such as an Eppendorf M4, with disposable tips capable of dispensing 25 µL, 50 µL and 100 µL is recommended to obtain acceptable CVs.

Colorimetric 96 well microplate reader capable of reading optical density at 450 nm.

Software for converting raw relative optical density readings from the plate reader and carrying out four parameter logistic curve (4PLC) fitting. Contact your plate reader manufacturer for details.

PRECAUTIONS

As with all such products, this kit should only be used by qualified personnel who have had laboratory safety instruction. The complete insert should be read and understood before attempting to use the product.

The antibody coated plate needs to be stored desiccated. The silica gel pack included in the foil ziploc bag will keep the plate dry. The silica gel pack will turn from blue to pink if the ziploc has not been closed properly.

This kit utilizes a peroxidase-based readout system. Buffers, including other manufacturers Wash Buffers, containing sodium azide will inhibit color production from the enzyme. Make sure all buffers used for samples are azide free. Ensure that any plate washing system is rinsed well with deionized water prior to using the supplied Wash Buffer as prepared on Page 8.

The Stop Solution is acid. The solution should not come in contact with skin or eyes. Take appropriate precautions when handling this reagent.
SAMPLE TYPES

This assay has been tested and validated with extracted and dried Dungeness crab hemolymph samples. 20-Hydroxyecdysone is identical across millions of species including arthropods and variety of plant species. Therefore, we expect this kit to measure 20-hydroxyecdysone in all sources including animal and plant extracts. The end user should evaluate the extraction recoveries of 20-hydroxyecdysone in other samples being tested. To evaluate the extraction efficiency run each sample with and without a known amount of 20-hydroxyecdysone standard added (spiked) and an assay buffer control (similarly spiked) for comparison.

SAMPLE PREPARATION

Samples may need to be extracted depending on source. We suggest a study of the literature to determine suitable methods of isolating 20-Hydroxyecdysone from organisms and plants.

Hemolymph Samples

It is recommended to perform an extraction of hemolymph samples with methanol prior to testing to remove matrix effects. Hemolymph samples are extracted by taking one part of aqueous sample and adding 3 volumes of chilled methanol (75% of total volume) and vortexing for 30 seconds. Centrifuge the solution at 10,000 rpm for 10 min at 4°C. Supernatant is carefully drawn out without disturbing the pellet and dried down completely using a centrifugal concentrator at 30°C for 2-3 hrs. The dried powder/pellet can be stored at -20°C until assayed, or can be dissolved in a minimum of 125µL assay buffer to run immediately.10,11

Extraction Efficiency Determination

We suggest checking the efficiency of extraction by preparing a 20-hydroxyecdysone solution of known concentration in the kit Assay Buffer (AB). Spike one aliquot of your sample with a volume of the steroid solution in AB (Control Spike) and one aliquot of sample with the same volume of AB (Control Sample). Extract samples and Controls with chilled methanol as described above. Efficiency is calculated as below:

Determine the extraction efficiency by comparing the concentration of the steroid measured in the extracted Control (Control Spike-Control Sample) with the concentration of the steroid measured before extraction (steroid solution of known concentration). Further details on extractions, assays and extraction efficiency can be found at https://www.scribd.com/document/57985925/Brown-2005

**REAGENT PREPARATION**

Allow the kit reagents to come to room temperature for 30 minutes. Ensure that all samples have reached room temperature and have been diluted as appropriate prior to running them in the kit.

**Assay Buffer**
Dilute Assay Buffer Concentrate 1:5 by adding one part of the concentrate to four parts of deionized water. Once diluted this is stable for 3 months at 4°C.

**Wash Buffer**
Dilute Wash Buffer Concentrate 1:20 by adding one part of the concentrate to nineteen parts of deionized water. Once diluted this is stable at room temperature for 3 months.

**Standard Preparation**
Label test tubes as #1 through #7. Pipet 990 µL of Assay Buffer into tube #1 and 300 µL into tubes #2 to #7. The 20-hydroxyecdysone stock solution contains an organic solvent. Prerinse the pipet tip several times to ensure accurate delivery. Carefully add 10 µL of the 20-hydroxyecdysone stock solution to tube #1 and vortex completely. Take 200 µL of the 20-hydroxyecdysone solution in tube #1 and add it to tube #2 and vortex completely. Repeat the serial dilutions for tubes #3 through #7. The concentration of 20-hydroxyecdysone in the tubes will be 25,000, 10,000, 4,000, 1,600, 640, 256 and 102.4 pg/mL.

Use all Standards within 2 hour of preparation.

ASSAY PROTOCOL

We recommend that all standards and samples be run in duplicate to allow the end user to accurately determine 20-Hydroxyecdysone concentrations.

1. Use the plate layout sheet on the back page to aid in proper sample and standard identification.
2. Pipet 50 µL of samples or standards into wells in the plate.
3. Pipet 75 µL of Assay Buffer into the non-specific binding (NSB) wells.
4. Pipet 50 µL of Assay Buffer into into the maximum binding (B0 or Zero standard) wells.
5. Add 25 µL of the DetectX® 20-Hydroxyecdysone Conjugate to each well using a repeater pipet.
6. Add 25 µL of the DetectX® 20-Hydroxyecdysone Antibody to each well, except the NSB wells, using a repeater pipet.
7. Gently tap the sides of the plate to ensure adequate mixing of the reagents. Cover the plate with the plate sealer and shake at room temperature for 2 hours. If the plate is not shaken signals bound will be approximately 20% lower.
8. Aspirate the plate and wash each well 4 times with 300 µL wash buffer. Tap the plate dry on clean absorbent towels.
9. Add 100 µL of the TMB Substrate to each well, using a repeater pipet.
10. Incubate the plate at room temperature for 30 minutes without shaking.
11. Add 50 µL of the Stop Solution to each well, using a repeater pipet.
12. Read the optical density generated from each well in a plate reader capable of reading at 450 nm.
13. Use the plate reader’s built-in 4PLC software capabilities to calculate 20-Hydroxyecdysone concentration for each sample.

NOTE: If you are using only part of a strip well plate, at the end of the assay throw away the used wells and retain the plate frame for use with the remaining unused wells.
CALCULATION OF RESULTS

Average the duplicate OD readings for each standard and sample. Create a standard curve by reducing the data using the 4PLC fitting routine on the plate reader, after subtracting the mean OD's for the NSB. The sample concentrations obtained, calculated from the %B/B0 curve, should be multiplied by the dilution factor to obtain neat sample values.

Or use the online tool from MyAssays to calculate the data:
www.myassays.com/arbor-assays-detectx-20-hydroxyecdysone-eia-kit.assay

Typical Standard Curves

Always run your own standard curves for calculation of results. Do not use this data.

**VALIDATION DATA**

**Sensitivity and Limit of Detection**
Sensitivity was calculated by comparing the OD’s for twenty wells run for each of the B0 and standard #7. The detection limit was determined at two (2) standard deviations from the B0 along the standard curve. **Sensitivity was determined as 197.8 pg/mL.**

The Limit of Detection for the assay was determined in a similar manner by comparing the OD’s for twenty runs for each of the zero standard and a low concentration sample. **Limit of Detection was determined as 139.8 pg/mL.**
**Linearity**

Linearity was determined by taking two spiked hemolymph samples diluted 1:20, one with a low 20-hydroxyecdysone level of 1,478 pg/mL and one with a higher level of 9,256 pg/mL and mixing them in the ratios given below. The measured concentrations were compared to the expected values based on the ratios used.

SAMPLE VALUES

This assay has been tested and validated with extracted Dungeness crab and crayfish hemolymph samples. In Dungeness crab, the concentrations of ecdysones are low during intermolt (~20 ng/mL) and maximal during premolt (~2000 ng/mL)\textsuperscript{10}. In crayfish, the ecdysone level can increase to ~60 ng/mL during natural molts and ~80 ng/mL during induced molts\textsuperscript{12}. Three Dungeness crab hemolymph during intermolt phase were assayed to yield concentrations ranging from 30.7 to 34.0 ng/mL with an average of 31.9 ng/mL. Four crayfish hemolymph during induced molts and three during natural molts were assayed as represented in the graph below. Induced molting sample concentrations measured 38.8 and 57.5 pg/mL and one natural molting sample was measured at 42.4 pg/mL. Results were comparable to published literature\textsuperscript{12}.

![Graph showing 20-Hydroxyecdysone in Hemolymph (pg/mL)]

Samples were generously provided by Professor Sherry Tamone, University of Alaska Southeast for Dungeness crab hemolymph and Dr. Elizabeth Addis, Gonzaga University for Crayfish hemolymph.

OFFICIAL SUPPLIER TO ISWE

Arbor Assays and the International Society of Wildlife Endocrinology (ISWE) signed an exclusive agreement for Arbor Assays to supply ISWE members with EIA kits for wildlife conservation research.

The antiserum used in this kit was produced for the laboratories of Mark R. Brown and Michael R. Strand (University of Georgia, Athens, GA U.S.A) and used to develop specific immunoassays to measure ecdysteroids in mosquitoes. DetectX®, ThioStar® and the Arbor Assays logo are all registered trademarks.
